Prologue

Our world has been plagued by war for over 14 years now. Who started it? Everyone has forgotten by now. No place has been left untouched by this war except one country, the United States of America. For so long our country has done nothing but watch. The government's hope? To wait it all out, under their giant energy shield encompassing the entire half of the country, the side we all live on.

As other countries fight for their very existence, we thrive. Medical advancements that were once thought of as impossible are now a reality. Our jobs, our lives, all based on what ever genes are injected into us before we are even born. Everyone has a job in this country, and everyone matters. That is why we are the greatest nation on earth. We live in a perfect safe haven, where no one gets in, or out. Unless of course, you disobey the rules.

TomTom has just announced the Spark, its new fitness watch with a focus on music. Other than its ability to hold your tunes, there are a number of small improvements to the tech. TomTom co-founder Peter-Frans Pauwels also told me that it will be getting some smarter functionality later in the year. Through a future software update, the TomTom Spark will get call and message notifications. You won't be able to read messages on the watch itself, but it will let you know the ID of whoever is trying to get hold of you. "We don't want to go fully into being a phone replacement," said Pauwels, who hinted that the feature was partly introduced because female clothing often does not include pant pockets - making a notification on the wrist particularly handy. "For guys, notifications are not important because you have them in your pocket. For females, they have it in their bag." Pauwels said that TomTom still does not consider the Spark a "smartwatch", but the introduction of phone notifications will certainly move the watch further in that direction. The bad news, however, is that those of you rocking the older models won't be getting the new feature - it will only be rolling out to the Spark. Sorry about that. Everything you've missed from IFA so far... Text using the WordPress visual editor jcole · Builder Modules Medicine Matters is a place to share department news in a way that is accessible to all and discuss issues and challenges important to our faculty, staff and academic medicine overall... read more » A popular Internet search engine developed by Open Text Corporation. Though not the most complete Web index, Open Text is considered by many to be the most sophisticated because it provides powerful ways to fine-tune a query. Open Text Corporation licenses its search engine software as a product called LiveLink. Over the past few years, The Joint Commission, an independent, not-for-profit organization that accredits and certifies nearly 21,000 U.S. healthcare organizations and programs, has had a change of heart about the use of texting patient orders. In 2011, the organization banned the transmission of HIPAA protected health information (PHI) via text message by personal mobile devices. Specifically, physicians and licensed independent practitioners (LIP) were not allowed to text any orders regarding care, services or treatment to hospitals or other kinds of healthcare facilities. This decision was handed down because it was believed that the technological capabilities were insufficient to support the safety and security of information contained in text messages of patient care orders. Then, in May 2016, The Joint Commission lifted the ban after determining that there had been sufficient technological advances in security and safety to support the secure texting of orders. As long as healthcare practitioners followed certain professional standards and guidelines, laws and regulations, and policies and procedures, patient care orders could be sent on a secure text messaging system. But the rollout of this new policy hit a snag and was halted in the following month. Even though patient orders were to be sent on secure text messaging systems, concerns still lingered that there needed to be further security measures implemented for texting orders. The Joint Commission was working in collaboration with the Centers for Medicare and Medicaid Services to ensure that the ruling was congruent with Medicare's conditions of participation. While healthcare providers waited for clarification, in December 2016, The Joint Commission along with the Centers for Medicare and Medicaid Services decided that the previous ruling should be rolled back to 2011 standards. Specifically, this means the following: What's known as computerized provider order entry (CPOE) is now the preferred method for order submission, so providers can enter orders into electronic health records (EHR) directly. CPOE has become more and more available via encrypted, secure applications for both smartphones and tablets. The Joint Commission believes that this would reduce the burden of the implementation of this policy. If a CPOE or a patient care order cannot be electronically submitted, a verbal order may be used, but only as a last resort. Verbal orders should not be used as a shortcut by the ordering healthcare practitioner. In the past few years, generally speaking, the technology for secured text messaging has advanced, where messages are encrypted end-on-end. With that in mind, it's unclear as to why The Joint Commission and the Centers for Medicare and Medicaid Services jointly decided to indefinitely end the use of securely texting patient orders. However, they did find at least three issues in their review of this policy. 1. A possible increase in workload for nurses. The implementation of an additional routine — the manual transcription of text orders into electronic health records — could detract from the ability to carry out other pertinent patient care duties. 2. Verbal orders allow for real-time clarification. This is related to the first issue, the added step of transcribing texts. The benefit of adding secure text messages may be washed out by the task of transcribing the message. If there's a typo or a question about the text, then additional time is added when the ordering practitioner is contacted for further clarification. 3. Clinical decision support recommendations/alerts may take additional time. Like the second issue, a clinical decision support recommendation or alert may be made, and whoever is entering the information into the electronic health record may need to consult with the ordering practitioner for more information. If this is given verbally, then the information can be handled in real time. On the other hand, if this is given via text message, then the transcriber must contact the ordering practitioner. These additional steps may delay treatment. Although these are some compelling reasons given — increased workload, decreased clarity and delayed treatment — mobile devices are becoming more and more a part of professional life, and not just as a means to electronically transmit patient health information into electronic health records. With this indefinite ban of secure text messaging for orders that was just recently implemented by The Joint Commission, I would love for healthcare sector leaders to look around and think about how we can provide a positive experience using technology. That is the digital world that we live in. Healthcare is unique and challenging, but so is every other industry and I don't see other industries limiting the use of technology as much as the healthcare sector does. Windows: Finding a good text editor can be tough. Some lack basic features, like spell checking, and others are so heavy they may as well be word processors. Write! is a new application, currently in beta, that rides the sweet spot and delivers the features you'd actually find useful without the cruft (or system bloat) you don't want. Write is gorgeous, and has an interface that fits right in with Windows 10 (or Windows 8 for that matter.) You get your choice of interface: a tabbed interface for multiple documents (although you can ever only see one at a time), a simple, borderless window for distraction-free writing and note taking, or a heavier Word-like UI that includes menus and toolbars. Write! also includes automatic spell-checking, a dark mode and a light mode so suit your preferences, tunable auto-completes that can learn to finish your words for you, tons of keyboard shortcuts and key commands to save you time, support for Markdown, Wiki, and Textile syntax, and productivity counters for things like pages, word count, and more than you can set as goals. The app also auto-saves your work all the time, so you don't have to worry about doing it yourself. If you sign up for an account (which you'll have to do to download the app) Write! will also automatically save your folders and documents online for you too, so you can get at them from any other computer. You also get unlimited undo, so pressing Ctrl+Z even after closing and opening a document—or even moving to another computer—actually undoes the last action in the doc. You can also organize your documents into writing "sessions," which are, like session-saving in Chrome or Firefox, available to open, close, and re-open on other computers. Write! is Windows-only, right now, with OS X and Linux versions of the app on the way. Some of the banner features (like cloud saving and unlimited undo) are free for "early adopters," (aka everyone who signs up right now) while everything else will be free forever. The service plans to introduce "Pro" accounts in the future that make use of some of those connected features. G/O Media may get a commission Write!
