This monitors 1920 X 1200 native resolution is great for HD video playback, plus its 1610 aspect ratio offers sweet wide screen viewing.

In addition, its factory colorcalibration means that you can view vivid, truetolife colors with a minimal need for tweaking. If you do want to make tweaks, there are simple easy to use capacitive touch switches on the side of the display. The display features VGA, DisplayPort, DVI, HMDI, Component Video, and Composite Video connections, so that you can connect your computer, gaming consoles, Bluray players, and more. If you do want to make tweaks, there are simple easy to use capacitive touch switches on the side of the display.A media card reader is included for viewing content from a flash memory card, and four USB 2.0 ports are also included in case you want to

connect peripherals, such as a keyboard, mouse, or thumb drive. All told, this monitor is ideal for professional graphics work and for athome video or gaming entertainment. The User Experience PictureinPicture and PicturebyPicture MultiViews View a smaller subscreen within your main screen, or two screens at once, using intuitive onscreen controls Flexible Viewing and Mounting Options Customize your viewing experience with the heightadjustable stand and tilt, swivel and pivot features. Or save valuable desktop space by detaching the panel from the stand for wall mounting wall mounting equipment sold separately Intuitive Controls Easily manipulate theon screen display with capacitivetouch switches Variety of Connections Enhance sound and picture quality with HDMI, Display Port and DVID digital connector with highbandwidth Digital Copy Protection HDCP Ready. Composite and component connections, 4 USB ports and a media card reader allow easy connection of peripherals like cameras and game consoles Beauty of PremierColor Technology PremierColor Technology PremierColor technology enables the Dell UltraSharp U2410 monitor to deliver vibrant, consistent, truetolife colors and minimizes the need for further calibration.

Let us know YOUR RECENTLY VIEWED ITEMS Browsing History ON Clear History Not responsible for typographical or illustrative errors. Learn More Since then it has kept the ball rolling with its 2407WFP and 2408WFP in 2007 and 2008 respectively, and though the U2410 actually came out at the tailend of 2009 it's pretty much in line with Dell's logical naming scheme. This is the first in the 24in range to consistently ditch PVA panels in favour of IPS, which is arguably a superior technology, especially for colourcritical work. Its new HIPS screen enables the UltraSharp U2410 to offer some pretty impressive specifications, not least of which are an 8,0001 claimed dynamic contrast ratio and 96 per cent Adobe RGB 110 per cent sRGB colour gamut. Together with a low response time, Dell's usual plethora of connections and full adjustability, is this the monitor to topple the brilliant HP LP2475w from its throne. Let's find out. It comes in two parts which easily yet securely click into each other and come apart again at the touch of a button, with no screws or other complications. The only slight niggle is that since the screen only lifts 11.5cm off its base 13cm off your desk, you still need to tilt it back to pivot it. There was also an issue which we assume is just a glitch with our specific sample where the screen in landscape mode was not level, but rather it was tilted by a degree or two. Connectivity hasn't changed much from the U2410's predecessors, which is no big deal since they were already more than generous. Behind the bezel and to the left you'll find two of the monitor's four USB hub inputs, together with a memory card reader and a pullout plastic tag with all the monitor's information printed on it a far easier to access, betterlooking and longerlasting solution than the sticker found on the back of almost all other monitors. It's a pity that the card reader no longer supports CompactFlash as previous models did.

Some users will be sorry to hear the SVideo present on older UtraSharps is on the casualty list. This brings us to the one area where we really wish Dell would up its game though a 3.5mm analogue audio output and Dell speaker bar connection is provided to carry sound from HDMI, we would prefer a digital output as found on the HP LP2475w. That's not to say the U2410 hasn't had a bit of a visual upgrade though, and we like what we see. Both the stand's leg and a narrow strip running around the sides are gunmetal grey rather than the previous silver, and aside from the chromed Dell logo the rest of this monitor is unrelieved black. It makes a somewhat more subdued but also more stylish impression, and wouldn't look out of place on any desk. Every highend Dell up to the recent 2408WFP had a set of six buttons along the right bottom edge of the bezel, but like with the 27in 2708WFP before it the U2410 offers a set of touchsensitive ones, removing the only visual blemish of previous designs. These are located just above the square, bluebacklit orange when in standby power button in the lower right corner. Unfortunately the power button's backlighting can't be turned off, though it's subtle enough to not be a possible distraction in anything but a dark room. Once you press it, the other controls light up and can now be used in conjunction with the contextsensitive onscreen menus. The U2410's system makes it easy to configure in the dark, especially as the controls are wellspaced and very sensitive. There's also an optional sound to denote

a press which is thankfully turned off by default, and we never missed it. Our only real gripe with the new control system is that, where before you could press a shortcut button instantly, it now requires two presses one to activate the button and another to actually use it.All the usual adjustments are present, and in some areas Dell goes well beyond the call of duty.

In the Custom Color preset mode other modes include Standard, Multimedia, Game, Warm, Cool, Adobe RGB and sRGB, for example, you can adjust RGB in both Gain and Offset, and in Hue and Saturation you can adjust not just RGB, but CMY too. Sharpness is still adjusted in 10 per cent increments and menu rotation is still manual where some highend screens have a sensor that automatically adjusts this, but on the bright side DisplayPort has been added to the PIP Picture In Picture selection. As with any monitor, the most important factor is of course image quality.Though those on the admittedly far cheaper Samsung SyncMaster F2080 using a cPVA panel were decent, the U2410 is on a whole other level, with none of the contrast shift we noted there. Comparing apples to apples, this Dell is even slightly better than HP's LP2475w, which also uses HIPS and had delivered one of the most impressive performances we had previously come across for under 500. In fact, after calibration with the Datacolor Spyder3 Express colorimeter, there was almost no discernible difference between the postcalibration profile and Dell's factory Adobe RGB preset. So, is this the ideal outofthebox monitor for imaging professionals at its price point. Unfortunately, not quite; the Adobe RGB preset was marred by a very strange dithering pattern over midtone grey shades that we could not completely get rid of, no matter how many settings we altered. It's a real shame too considering the otherwise excellent performance, but at least it disappears if you change presets. Hopefully Dell will fix this in a future revision, as there is no good reason for a highquality 8bit panel with 12bit processing to suffer from dithering artifacts. Aspect ratios comprise Fill, Aspect and 11, which offer an ideal option for every scenario. In use the U2410 did get very warm along the top, but there was no audible operating noise.

Another point to note is that it does take a while to start up when you turn it on about eight seconds, but that's hardly a big deal. In fact it's available for around 420 making it slightly cheaper than the Dell. Though the HP offers greater height adjustment, the U2410 beats it hands down in every other way, offering smoother adjustments, superior build quality and far nicer looks. When it comes to connectivity, the U2410 gets you a card reader and a dedicated VGA port, but the LP2475w wins out with an extra two USB ports and a digital coaxial audio output for passthrough of sound from an HDMI input. In fact it would probably win if it weren't for the dithering pattern we came across, though this is circumvented by avoiding the Adobe RGB preset. On the other hand the HP LP2475w appears to suffer from poor quality control on panels if the comments on our review are anything to go by, so the Dell is still likely to be the safer bet. Minor flaws aside, it's the best 24in monitor available for the money right now, whether you're a discerning gamer, graphics enthusiast or just someone who likes working on an excellent screen. We use industry standard tests in order to compare features properly. We'll always tell you what we find. We never, ever accept money to review a product. Best monitor ever. Contrast is simply amazing. With PremierColor technology, this monitor allows for beautifully vivid colors in images and videos. Dell U2410 integrated Power Nap software and IPS Technology provide the least amount of color deviation possible. This model is also made with ecofriendliness in mind, beating ENERGY STAR, EPEAT Gold, and TCO Certified Display standards and using little electrical power. You can even conserve desk space thanks to Dell Ultrasharp Ushaped base and flexible mounting options. Connect easily with HDMI capability, DVI digital connectors, four USB ports, and a media card reader. Better than I had expected it to be from some reviews.

Native color really quite good and very close to corrected with XRite tools. I like the way the stand works large stable heavy footprint, ad the height and rotation adjustments easy to use. Cable access is as usual a bit unwieldy, but the cables thread nicely through a large slot in the stand keeping

things neat back there. Quick access to all adjustments through the touch buttons works extremely well f or me though it is easy to accidently turn them on when moving the monitor as the lower corner is where one just naturally takes hold of the case just have to get used to it and no big deal to turn of the controls when it happens. The controls are easy and sensible. The display has sharp resolution and the colors are amazing. The reliability based on previous Dell products should be good. There are two things that were postive surprises. The stand with which the monitor came was simple to adjust. After one attaches the stand to the monitor which is very uncomplicated all one has to do to adjust is simply move the monitor up or down or tilt and the monitor will stay where it is put. The second surprise was the ability to hook a USB cable supplied from the computer to the monitor per instructions. That allowed 4 other USB ports to become active and is helpful when we run out of USB ports. The only complaint I have with the equipment is the lack of documentation. The two surprises were fully realized after spending a considerable amount of time on the phone with Dell. Because the instructions were severly limited, one had to rely on trying to convince Dell they needed to help you with out a viable service tag number. Dell is into some documentation service tage number, express number showing one has a right to ask their staff questions without paying a fee. This doesnt apply to their sales agents I am a big fan of Dell but this is one item that would almost having me buying my next computer somewhere else. I am looking forward to using this monitor.

My hobby is photography and I am thrilled with the simple changes to the display from which one can go from sRGB to Adobe RGB. The monitor is precalibrated accordingly. The switch is triggered with some buttons almost hidden on the bottom right hand corner of the monitor fram on front. I got three and cherry picked the best two and am really happy with them. They come with calibration printouts from the factory and my own testing with an i1 Display II and EyeOne Match 3 gave very similar results. All three were very good but one had slightly more color error than the others. Overall color accuracy was excellent. These are IPS panels so there is a slight greenpink shift across the screen but not bad enough to be a problem, even with two sitting side by side right pink butting up against left green. Text on these is excellent, maybe even better than my reference monitor NEC 3090, and the colour gamut is also excellent. They dont get max rating because they lack internal color correction tables at least accessible to me, the factory clearly can adjust them, and their colour gamut isnt quite as good as the 3090. Ive profiled it twice using the EyeOne system. Both times the contrast has to be set at 100 and the brightness lowered, once to zero then next time to 7. You can adjust the RGB values but its a little tricky figuring out what menu to use. Both times Ive profiled my gamma comes out to 2.3, color temp 6500K, and luminance is okay. I didnt buy the monitor from Dell, and trying to figure out if the monitor is under a Dell warranty is a frustrating exercise. The place I brought it from says it is, but Im not sure Dell thinks so. Hopefully it wont be an issue. I saved a bit of money buying from a nonDell source, but because of that Dell pretty much doesnt want to recognize the monitor or you as the purchaser. Great deal on a great monitor. My old eyes are getting pretty bad, but this monitor running 200% is bold, clear, and very easy for me to see.

Im very happy so far. Verisign. Perfect to keep up with community on your smartphone. Since Premiere CS6 is not color managed as far as I know, I usually switch to sRGB profile of the monitor to get normal color saturation. If I leave it at AdobeRGB preset mode that I use for everything else, colors of the video are over saturated, like any other non managed srgb content on a wide gamut monitor. I dont need absolute accuracy here, only some decent reference point. If your colors are still bad you should invest in good sRGB monitor or monitor that has proper sRGB emulation Thats a hassle I know, I have to try it. If someone could test this and verify, or it is some weird bug, or I am just hallucinating. I had it last year and after some month I sold it again with a loss. Unfortunately I did not read this test before I bought it As its not linear you cannot correct it calibration. Maybe the corrected this since last year, but I dare to doubt it. U2711 is different in this point and therefore it should be better choice Have it for a year or so. I have 93 different color profiles to compensate for

its numerous quirks. Somehow managing to live with it for photo post.What standard are you calibrating your monitor too.Right or wrong, good monitor or bad, it seems to work for me. I spent many hours tweaking before I came to that conclusion. I found only funkiness using the presets and trying to match the 2 monitors sidebyside. My conclusion it was only possible with the custom color preset, the i1 pro basic, and making manual adjustments the i1 asked for. I do notice when calibrating, that slight adjustments are hard to dial in precisely, that having the green level at 93 adjusting it to 90 and then deciding to go back to 93, it will settle close but differently, even though numerically all the RGB settings are the same. Perhaps thats what the German article goes in depth about.

If the u2410 is really that problematic, whats a better monitor option Ive also heard that the ASUS IPS display is pretty decent. I have noticed that there is no fringing when its used in video mode, connected to HDMI, and image looks ok. I know that it is far from ideal solution, but do you guys think that It could be calibrated in that mode, and how So I have confirmation, my method see above works. It is obviously unfixable and I gave up on it. When I hook up the camera to it it also shows those color fringes, so it is not related to computer or profile. But when I switched in OSD from Graphic to Video, fringes were gone. And I figured out that I maybe might use it as that. The Dell would be the last monitor I would consider for doing any serious color graphics, video or photo work. But with proper calibration the Dell will be much better than the iMac display. The unit keeps turning off, and calls to Dell support yielded nothing useful. So, I tied together three rubber bands and looped one end over the corner of the monitor with the power switch, and the other over the bracket that holds the stand. It works great until a rubber band breaks and I have to do it over. The fix lasts about six months. If you want to get involved, click one of these buttons. However Ive reached my current knowledge limit and would be grateful of any help offered. This fault in a Dell U2410 monitor presents itself as a no power fault. No lights on power button and no change to the screen. I tested the connector and ribbon on the bottom right of the power board and found 3.70 volts on the first four wires from the left and 0.05 volts on the red wire far right. All other wires show 0 volts. Not knowing if it was the voltage being pulled down by a faulty main board or a low power output from the power supply board I disconnected the main board and retested. With the main board disconnected from the power board the voltages rise to 5.15 on the left four and 4.68 on the red wire.
