Heller 3.0 out of 5 stars It is surprisingly versatile given its price and ease of use I didnt want to spend the outrageous prices on some of the fancier models;just wanted something smaller but comparable because my professional SLR is an 8MP anyway so that wasnt even a concern. This camera was inexpensive,I was allowed to demonstrate it in the store and even told I could bring it back in the event that,once the photos were downloaded into my PC it didnt meet the basic quality needs. So for those looking for an inexpensive digital camera I am going to give you the facts and only the facts on this camera. Its really the only way to go in this situation. First the pros. This camera takes three AAA batteries and take optimum advantage of battery life.

It has a number of sophisticated settings such as picture size,a number of exposure options including compensation AND a superior set of lighting options. There are also controls for image quality and ISO settings. The actual image quality is where I have to go into the cons,especially when it comes transferring to your PC. What appears on the screen as you are composing is a very blurry and foggy image. And when you transfer the image to your PC and open it up with whatever system you are operating with,the image you'll see is very low in terms of sharpness on the same end. In my personal case I cleaned the lens of with my other camera's lens cloth beforehand and that's still what was produced a very poor image. Although the camera is 7.1MP the image quality,even at the highest quality settings which I had it on were grainier and low quality than the extremely poor images from my first digital camera Also it should be noted that the shutter response time,especially when the flash is activated is very slow and will result in even more blurred pictures if you don't keep the camera totally still and focused on your subject for less than 5/10 seconds. All in all the pictures taken with this are the equivalent of what you might've gotten on a camera phone image about four or five years ago closer at the very best settings to a 3MP quality than a 7.1MP one. So if you want very general images without any aspect of even fair looking pictures this will probably do just fine. It does have a good wealth of features. If you are a person looking to take good quality pictures to share online through email or even on Facebook the images this camera will provide just don't cut the mustard in that respect.Your best shot at taking a halfway decent picture with this thing is to have your subject stand outside in the bright daylight, and use the delay setting takes the picture either 2 or 10 seconds after you press the button.

Even then, you will probably have to take three pictures of the same person in the same pose to get it to come out with no blurs, or weird distribution of light in the picture. I've tried all the different settings. Just a crappy camera. If you do not need any better quality than you could get from the cheapest cell phone camera you ever had, then this camera will do. But you will have to fool with it more than a cheapie cell phone camera to get a picture that doesn't look like it was on Ghost Hunters.She was so excited when she opened it Christmas morning, and didn't even finish opening the rest of her gifts. Once it was all set up the festive Christmas mood in the house quickly went south. EVERY picture she took was dark and blurry to the point that you couldn't make out a person's face.
