However, some boards are not able to fully utilize all 4GB of installed RAM due to a major chipset flaw on some boards. It is not known if all systems are affected, but certain boards are more known for the problem then others including the system the author had at the time. The impact is negligible to nonexistent in most cases with bad systems. Impacted systems will show the 500MB loss with and without a GPU installed in the BIOS. The following boards exist for this machine well, at least what the Wiki creator knows about This is reportedly fixed with the 0HJ054 motherboard, since it is shared with the E510. You must use a backwards compatible SATA III drive or a controller card that bypasses the bus limited SATA interface. These will accept a Pentium D, but complain about missing microcode. These are also more likely to be nearly maxed out processor wise with a Pentium 4 installed from the factory. The system may not POST with a Pentium D installed. You MUST have the correct board for it to work correctly. These systems will be harder to come by. Dell uses a standard power supply, but the case is slightly larger. This will not impact replacement, but a small unit may leave a gap. This does not affect the system functionally if it happens. It is best to accept this then find a genuine unit as most of them will fail due to bad capacitors.

be sem kapcsol. Kedves kollegák ! Fura de ez a készülék, aksi nélkül be sem kapcsol. Ha kiveszem, akkor csak a led felvillan és utána semmi. Ha az aksi bent van, akkor bekapcsolt után a led felvillan, majd 5 mp szünet a led felvillan a venti felporog, majd kikapcsol. Az aksi mérése a töltés meggy. A kérdés. Lehet, hogy ez a típusú laptop csak jó aksival működik meg. Sokat javítottam már ezek közül de nem emlékszem ilyen esetre. Az alaplap típusa LA6592P udv. Dell E5530 biosz jelszó ker megoldva Volna egy dell e5530-as laptopom de nem tudom elindítani mert jelszó ker, volna valaki aki megoldana ezt a problémát, és volna egy másik gond hogy ki van szakadva a zsanérja, jó, de megkéne ragasztani, mivel érdemes. A cimbem említett laptop nem indul el csak felvillan a led kb 1 másodpercre és ennyi ha benne van az akku akkor is csak felvillan de kb 3 másodpercre és semmi. Találkozott már valaki ezzel a problémával Mit kellene megmérnem rajta Előre is köszönöm. Számomra furcsán nem működik ez a gép. Tapegyeségről csak rövid ideig 1020 s működik, azután hirtelen kikapcsol. Ezután már csak akkor lehet bekapcsolni, ha rövid időre kiveszem az akkuját. Azonban akku nélkül, csak hálózati tapegyeségről működtetve be sem lehet kapcsolni. Nos ez a utóbbi a fura A notebook gazdájának ismerose azt állítja, hogy ennek a típusnak így, vagyis csakis akkuval kell működnie. Köszönöm. Same user accounts, same synced cloud storage, same synced email, same synced web browsers. Suggested upgrade to a 5150 include D945 chip and 4 gigs of memory, it will run Windows 10 64 and 64 bit versions of Firefox, Chrome and MS Office. Also suggest a 2GB usb for ReadyBoost, OR a SSD drive. Post from 2016 Following up upgrading to a D945 chip was an easy swap, took about 510 minutes. Unclip processor cage, remove old processor. Clean the old paste off the heatsink, spread new paste on heatsink. Set D945 processor in place, reinstall heat sink, tighten 2 screws, close case, plug back in. With the D945 installed Windows 10 64bit installed fine, while the old P4 chip did run the commands for 64 bit windows, but didn't report it. I did notice that the 5150 didn't like installing Windows 10 from a bootable USB, so burned the Win10 64bit ISO and installed from DVD drive. Overclocking is possible also. But the 9150 is stuck with Pentium 4 CPUs which at their fastest
