Now let us begin our study trip. Usually, the r4i sdhc skin cab be changed with 3 steps. The above accessories are need for r4i sdhc kernel installation and skin change. R4i SDHC skin DIY Step 1 The first thing you need to do is to download some R4i SDHC themes or skins from some online websites which afford you with various kinds of themes and skins, such as ishopvideogame. Here is a little thing you should remember. All themes and skins for R4i SDHC online are free. This step is very easy. And you can save 8 thems at most. For default setting, there are 4 skins in R4i sdhc, they will change automatically for every season, of course, you can keep it if you like.

For more information, you can visit the r4i sdhc card official websites r4isdhc.com, which afford themes and skins. Some succeeded and some failed. This newcomer is entitled "R4DS" and since it is made by the same teams who made other leading Slot2 carts there is a lot to be expected by this jump to Slot1. This card has a ton of features that make it stand out above the rest, but the real question is will it succeed or fail Works on any OS Touchscreen or button operation It looks like it's molded from sturdy plastic and performs very well. The R4 is also molded in sturdy plastic and after I dropped it from varying heights, it never broke. The case to the R4 was in looked pretty cool as well, which is a plus in my book. The R4 also sports a holographic sticker on it which is cool. The R4 team was even nice enough to include a card holding case and a wrist strap. There's nothing like free goodies. The MicroSD slot has a built in lock mechanism which lets the MicroSD click into place nicely, and is a nice feature. If you wish to view pictures I took for this review, go to the bottom of the page and click on the image gallery link. I had my MicroSD loaded up when my R4DS came, but I have to tell you how setup is done. So you pop in the installation CD into your pc. When the PC has recognized the CD and has laded it you will be provided a few items to select from a few items. Click on the system v1.06 or whatever revision you have and open the folder. Now once you are in that folder you can drag everything in it to the root of your MicroSD card. You can now add folders to your MicroSD card, which contain games, homebrew, or media. For me I have 4 folders called Games, Homebrew, Media, GBA. For this review I'am using the latest firmware which is v1.09. The review may cover things that aren't available in the firmware you are using.

The main screen gives you three icons the 1st if the games browser, 2nd in the media player, 3rd allows you to boot a slot2 cart of you choice. For now I will explain the game browser. Pressing select lets your sort through different files types. From the game browser you can view eBooks also, you just have to change the file type to eBook. To view these hidden items in R4DS you simply push select in the browser. Moonshell can play DPG1 videos as well as MP3, WAV, WMA and other various audio formats. Video playback is smooth and is easy. You can view BMP, JPG, GIF, PNG picture formats as well. That's about it for Multimedia. Pushing the start button within Moonshell lets you return to the R4 menu. With this option you can boot any Slot2 flash cart into NDS mode. When I had a Supercard Lite it would boot to NDS mode with no problems at all. In firmware's v1.08 and above it auto detects whether you have a GBA game or Slot2 cart inserted. Sadly you can only boot slot2 carts to NDS mode only. When booting a NDS game for the first time you will be presented with a screen asking you whether you wish to create a saver file, so push A for yes. Nintendo WFC works great with no problems. Download play however is broken.Out of 30 homebrew I tried, only a quarter of them worked. This is due to the fact tat most homebrew don't support DLDI patching yet. DLDI patching lets you make the homebrew image compatible with the R4DS. The homebrew that did work performed well. I tried nesDS, snesDS, and picodrive emulators

and all worked and games played rather well.The price, compatibility, and features are just right. So I would recommend that you pick this one up. The R4DS, or R4 for short, has 12 themes and 13 settings. You can choose any of the 12, or you can choose Automatic Mode which chooses a new theme each month.This guide and two free software applications will help you do just that.It helps to use the same three icons and wallpapers for the other three screens, but if you want to have four unique images for each theme, thats 48 pictures to find.Henceforth this folder will be referred to as TEMP. Keep in mind that they are going to be resized to 256x192, so if you have a huge image, a lot of detail is going to be lost. Save each image to TEMP and name each file for the month its going to represent. By default it will go into View mode and fill your screen; press F11 to edit the image. It does not matter where. If its vertical like a cell phone, hit the Tab key to make it horizontal. Make it as large or as small as you like, but bear in mind the more detail you select, the less will be visible. XnView should fill in 192 for the second number. We want this. Where it says Save as type choose BMP Windows Bitmap at the very top. Save it in TEMP. The original name is fine, or append 256 to the end if you like. Henceforth these small bitmaps will be referred to as the 256 month images. In fact, at this point you may delete the original images, as you no longer need them for this project. These can differ from theme to theme, in which case youll want 12 of each; or they can be the same three icons. The first icon will load the R4s file manager, from which you can run Nintendo DS code. The second icon will load Moonshell, a secondary file manager which can play music, video, and display text files. A music note, video reel, or portable media player all work good. The third icon will load whatever is in the GBA slot, if anything is there at all. These should be Bitmaps as well. This tab controls the wallpaper on the top screen when you first turn on your DS. Find January256.

bmp and drop it on the big box in the upperleft corner. Alternately, use the zoom slider above the image to get it just right. This will change dynamically, so you can work with it to get the best look.The background is chosen the same way as before, but now you can add the three icons. Alice calls them Game, Media, and Slot2. Use the Browse button to find TEMP and choose DS, Media, and GBA, respectively. Choose the background for the file manager, and be sure to set the text and highlight colors accordingly to get the best look. The details on this and the next tab make quite the case for using the same settings on each theme. Again, follow the same steps as before and be sure the text is readable. Game Boy Advance games are widescreen, and rather than just have a black border to crop the screen, you can decorate this as well. Follow the instructions as before, just be aware most of your image will be covered up, all but the edges. Choose a title and enter your name. Neither shows up on the DS. Look at the export options on the left, set them accordingly, and choose Export. Browse to the month youre making, and save it there. If its April, theme04 will load. Cycle through all months to make sure each theme works. You can put both programs and your TEMP folder on a USB flash drive and work on this on other computers. The R4DS should only be used to load homebrew software or to play music or videos. To create this article, 22 people, some anonymous, worked to edit and improve it over time.
