Please contact them to ask about shipping. It has a well worn cover but stands in decent condition. Items must be returned in original, as shipped condition with all original packaging. Please check the fields highlighted in red. Currency. User patterns. Its compact, easy to use and can run on batteries or AC. The way the pads are laid out gives you 2. Each pad also has a separate send to the. It doesn't have DJ sets or building up your music tracks. This is one drum machine not from Future Music CD issue 78. I'm back again after being up to my chin in music and other PC. Which is now a laptop, because the desktop toasted but that's I'm back. With a question. I dropped off a bunch of music gear at Do you have the PDF or could Thanks. Kevin. The Nettles Progressive and Exciting Celtic Music. A 3 track pattern sequencer for rhythm, bass and external MIDI control, 400 Preset rhythm patterns, 100 User patterns, 128 Preset drum kits, 64 User drum kits and 20 songs. All in one tidy little unit. The top of the plastic case is pretty well crammed full of those nice rubbery function buttons and performance pads and a row of 8 knobs along top deal with modifying the audio signal. Unlike the diminutive Dr. Sample, which has 18 flashing backlit translucent buttons, the Dr. Groove has only five flashers, none of which are the drum pads, a shame but probably a good thing for battery life. Lack of velocity sensitive instrument pads is also a big disappointment although it does respond over MIDI. The LCD display is a standard dark grey on light grey 32 digit affair with no back light and hence almost invisible on a dimly lit stage. External power is supplied by a standard Boss 9v wall wart

DEDICATED PADS For a budget unit the DR202 has more dedicated controls than you would usually expect to find, which is fine by me and even though most of the editing controls are multifunction the editing process is still quite straight forward, once you take a few cursory scans through the instruction manual. When switched on the DR202 defaults to Pattern mode which allows you to start playing back some groovy beats immediately. If you select a new pattern while a current pattern is playing the lower half of the LCD shows the next pattern to be played see box for a list of preset pattern styles. At any time while a pattern or song is running you can play along with the drums, bass or an external MIDI source eg. These are marked with a C to C scale and the names of a basic drum kit Kick 1, Snare 1, Open HH, Hit 1 and so on. The pads play the bass and drum voices from whichever kit is programmed into the current pattern but you can change to other preset and custom kits while patterns are running. THE BANK OF INTERACTION If that isn't enough interaction for you then there's also the option of twiddling a few knobs. These fellas really spice up the sound and are what set the Dr. Groove apart from most other run of the mill drum machines. Having 14 VCFs at your disposal is a pretty awesome thought and the preset kits don't really take advantage of the extremes I'm sure some users are quite likely take this instrument to. Also with the additional ability to record ANY VCF knob movements to a pattern in realtime and you begin to appreciate what a capable little monster the DR202 is. How about an 808 or 909 kit with each percussion voice and the bass modified by a sweeping resonant VCF, mmm. music to my bleeding ears. Though it's not all plain sailing if you get the urge for a bit of hands on modifying over a pattern with previously

recorded knob twiddling, as you AND the Dr.Groove fight over who has control of those fabulous filter sweeps. <http://gokcebilgisayar.com/userfiles/compustat-database-manual.xml>

BEE PEE EM Patterns will always play back at the BPM they were programmed in whether in Song or Pattern mode but the BPM can be changed at any time by pressing the dedicated BPM button. With either a User or an edited Preset pattern the LCD shows two values, a fixed RECOMMENDED BPM the Pattern BPM and an adjustable BPM parameter. Once in this mode you can enter a new BPM using the data dial to the nearest 10th of a BPM or use the Tap button to change the BPM on the fly. To be honest I found the Tap method frustrating, and sometimes not too accurate. The Tap BPM rate is calculated from the first four beats you tap out, at which point the display changes to indicate TAP BPM. Solution Discipline, four taps and no more. If either control is turned clockwise beyond the OFF position the LCD changes to show the current effect parameter value, pressing the righthand cursor button scrolls the display through the various effect parameters for the current kit, which can then be adjusted using the data wheel. There are 8 reverb types, from halls to rooms, each with adjustable decay time and level and two types of delay, panning delay and stereo delay. The delay time can be set in milliseconds 5 ms 450 ms or in BPM related time divisions 10 settings from halfnote triplets to sixteenth note triplets. Although the effects features are limited they sound fine within the scope of a typical dance based rhythm. The effects parameters can be changed in realtime while a pattern or song is playing but any adjustments made cant be recorded to a pattern, as with the VCFs, and any changes made are lost if you select a new kit as its impossible to perform a save while a pattern or song is playing. RECORDING A PATTERN As with most pattern based drum machines you can record rhythm patterns in real time or step time.

The most obvious difference is that you dont need to specify which track to record to as drums, bass and external MIDI are allocated automatically, but the first thing to do before recording a pattern is to select a drum kit and BPM rate using the dedicated buttons. Realtime recording is the default mode and can only be activated by first selecting a User pattern. This can be either an empty location, an existing pattern or one of the preset patterns copied into an empty User location. Pressing REC button puts the Dr.Groove into Record Standby mode and sets the REC button flashing at the current tempo and starts the metronome ticking. You can also practice tapping out rhythms along with the metronome until you are ready to go for a take, a which point you hit the REC button or use the foot switch option. And basically thats it, simple. Adding or overdubbing bass lines or external MIDI notes is done in exactly the same way as track allocation is handled automatically. Step Time recording also used for editing patterns involves slightly more effort. Editing options available within Step Time mode are changing the Kit, changing effects, deleting and inserting notes, adjusting gate time, inserting portamento values, inserting Rolls, instrument timing shift, mute individual instruments without deleting them and copying and deleting patterns. If an external source such as a MIDI keyboard is used to input drum or bass data the Dr.Groove will record in Real or Step Time note velocity for bass and percussion instruments and portamento data for the bass. KIT IN A BOX The DR202 contains 128 preset rhythm kits each containing 13 different percussion sounds and one bass voice. Kit styles include Hip Hop 27 types !, Drum n bass, Techno, House, Jungle, Electro, Ambient, Acid Jazz, Funk and even a couple of Industrial kits. Of course there are plenty of Roland TR drum machine kits and a few customary, Rock, Pop and Latin kits.

<http://www.diamondsinthemaking.com/content/dish-network-vip222k-user-manual>

64 user kits are available, with various programmable parameters for each of the 14 voices. These include Instrument type from 256 available, level, pitch, pan, effect send and cutoff, resonance and decay for VCF control, not a bad lineup. Kit construction basically involves tapping a pad, selecting a voice for that pad adjusting the parameters for the voice and moving on to the next pad. Kits can also be named and copied. I must say I sometimes found the limit of 13 percussion instruments per kit a slight hindrance for creating really adventurous custom setups but nevertheless some pretty

decent kits can be put together quickly and easily if you can't find one from the 128 presets. **SONG TIME** Once all your rhythm patterns are assembled you can think about putting a song together which is achieved in a similar manner to Step Time pattern recording, but with less options to worry about. Press the Song button for Song Mode, select an empty song location from the 19 available, give it a name, hit the REC button and use the data dial to select from the available Preset or User patterns. A Song BPM figure 40 250 can be programmed to override the pattern BPMs and patterns can be inserted or deleted into an existing song and completed songs can be copied to new locations. **ARSENAL OF SOUNDS** The Dr.Groove includes a full compliment of 207 drum, percussion and SFX samples and 49 bass samples, including essential dance stalwarts such as the TR707, TR808 and TR909 and acoustic, electronic and distorted kick drums, snares, cymbals, blips, clicks, vinyl scratches which the manual quaintly refers to as plastic scratches, reversed percussion, even the ancient Roland CR78 is included. Bass samples include everything from sawtooth, square and sine waves, electric and acoustic bass guitars, various SH101 waves and of course a selection of TB303 samples notice the emphasis on Roland rhythm machines anyone. But what does it sound like, I hear you say Well.pretty good actually.

With the right kit and some judicious use of the Low Boost control the Dr.Groove can really kick you in the guts. On the whole the sound is more budget than pro and some samples lack a little presence and oomph. But let me quickly say that I don't think it really matters a jot that these samples don't sound like they're being produced by a top of the range 16 bit sampler, especially in this price range. Dance music is rarely about quality and more about feel and emotion and the arsenal of sound shaping tools, patterns, styles and overall grooviness of the DR202 compensate for any minor failings in the sound of the raw samples. **GROOVES ON A PLATE** If you've had any dealings with constructing rhythms using a software sequencer then you've probably come across groove templates before. Here they do the same thing, essentially quantizing the timing and accents of a pattern to a preset rhythmic template. This is done without actually changing the content of the pattern just the rhythmic feel of it and the pattern can be returned to its original state at any time. In the Dr.Groove templates can only be used on User patterns or Preset patterns copied to a User location and are applied using the dedicated Groove button. Depending on the complexity of the rhythm the process can be a little slow as the groove template is applied to all three tracks in a pattern. Also, the DR202 insists on applying a groove template each time you select a new one from the list, no fast scrolling to the end or middle of the list, you have to step through each template and wait for it to be processed before you can move on to the next. But these foibles aside, groove templates are an invaluable tool for breathing new life into plodding or uninspired rhythms and although the 20 templates here are uneditable there are enough to accommodate most dance styles. **FLAM ROLLS** The Dr.Groove roll function is a little special, and unusual.

It offers 68 preprogrammed drum roll patterns including regular fillins and flams but also complete rhythmic phrases and dynamically filtered rolls. The Roll button can also be latched to allow individual percussion sounds to keep repeating ad infinitum while you play other nonrolling pads. **MIDI** The Dr.Groove has a full, if slightly frustrating MIDI implementation. SysEx loading and dumping of all the internal kits, patterns and setups is catered for, as is setting MIDI channels for bass, drums and external MIDI in and out. It also responds and transmits MIDI Volume, Pan and control change for each track, Program change for selecting Kits, Portamento data for the Bass, all the VCF real time controllers, effects levels and internal or external MIDI sequencer control of Start, Stop, Continue. The Bass and external sequencer tracks will also respond to MIDI Modulation and Pitchbend, great for expressive bass lines, however the sequencer tracks will not record either Modulation or Pitchbend, a disappointment. The instruction manual doesn't give any specification for sequencer memory other than the maximum number of measures per pattern, 8 and maximum number of patterns per song, 999. I tried recording a busy 8 bar rhythm pattern containing drums,

bass and some MIDI sequences and chords, I then copied 100 patterns into a song and copied the song 19 times and the available memory still read 60%, so no problems there. Roland see this as the ideal combination and supply details of how to link the two Doctors together and run the builtin and syncable demos in tandem, to great effect I might add. With so many instantly accessible and usable bass and drum patterns and styles available at the touch of a few buttons even pros wanting to bang out top notch dance rhythms quickly and easily while those creative juices are flowing need look no further than the Boss Dr.Groove. Bottom line.highly recommended for ANYONE producing dance music.

BOXES SUMMARY So chock full of groovy goodies it hurts. 256 drum and bass samples, 3 track pattern sequencer, external MIDI control, realtime control of multiple VCFs, digital effects, groove templates and literally hundreds of authentic dance patterns and kits. Exceptional value for money and little to complain about, this box of tricks sounds as good as it looks and has success written all over it. **PROS** Affordable and easy to use. Hundreds of great dance patterns and styles. Plenty of dedicated buttons and realtime control knobs. Some unique features. Portable and with a decent battery life. Very very groovy. **CONS** Pads not velocity sensitive or backlit. Realtime effects control not recordable. I want to MIDI out of the device into Impulse, use the patterns from the drum machine. I have a Yamaha UX16 MIDI to USB with driver installed. I long ago lost the manual to the drum machine. I have no idea how to get these two talking to each other. Any advice and or instruction would e greatly appreciated. Other devices work great with Live, the Novation Launchpad and my MAudio keyboard, but these are newer devices. I have been able to get audio out of the drum machine and record it to a track, but no MIDI. Heres the link.scroll down to find it. Sorry for the sarcasm It looks as though it should be possible. I have read and attempted all settings. Live notices a device, but does not receive a signal. Someone else may shed some light on this. Oh and make sure the Midi channels correspond.
