Powered Scooters have arrived so gas scooters are on sale. ElectricBuy hot toys and hobbies like Ride On Cars for kids with parental remote control, RC Helicopters, Nitro Rc Cars, RC Cars, RC Planes, RC Submarines, RC Toys, and RC boats. Motorized Scooters, Mini RC, and Toy Robots are a hot trend at toy stores. Wholesale Toys for stores are available for purchase. Shop cool toys for sale at our online Toy Stores. The smallest changes can make a huge difference in the way your car performs on the track and our comprehensive instructions will help you to find the best Setup to get you where you want to be. It is generally cheaper than new, ready built and may come with a variety of expensive hopups already installed. Cheap, preloved bargains are always becoming available. However, depending on the age of your purchase, it may need a little tender loving care before you can take it out on the back yard. The one thing you will always need is an instruction manual. If not supplied with your purchase, they can often be downloaded from the Duratrax website, or purchased separately on eBay. With an instruction manual, any problems with your model Buggy you may discover, can easily be fixed. Then, take a screwdriver and box spanner and check each self tapping screw and nut for security, taking care not to over tighten. Next, for those Duratrax models with oil filled shock absorbers, remove them from the chassis and dismantle the coil springs.

The damper shafts should push in and pull out with a smooth action. If you feel a jolt as you change direction, this means the oil has leaked out and must be topped up. At the same time, change the ORing seals to prevent more leakage. Also check the damper shafts for damage. If they are scratched, change them as soon as possible. Also, for added protection and if available for your Nitro Evader BX model, fit an under guard to stop dirt and gravel entering the chassis. If possible, change them for titanium. The steel shafts wear and bend too easily. If you intend to race your Nitro Evader BX Buggy model at a competitive level, I would also recommend you obtain and fit titanium pivot shafts, turnbuckles, tie rods and steering rods. A thin coat of grease is often used on internal gears and although this is fine for basic running around on the back yard, if you intend to race your Buggy at a higher level, this should be removed and replaced with racing oil ZX1 or Teflon Oil. Of course, this should be reapplied after each race meeting. Head on collisions can easily damage the gear teeth on nylon and plastic spur gears. Heavy impacts can also loosen the nuts or self tapping screws that hold the Nitro Engine in Position, allowing the pinion gear to pull out of mesh slightly and rip the tops off the teeth on your spur gear. To minimise this possibility, fit bolts with locking nuts to the Nitro Engine mount and remember to check them for security after every two or three runs. A simple thing like a loose fitting connector popping off could easily end your race, so better safe than sorry. Check out my Servo Information article. Dust and grit can get into these bearings and abrade the shafts. Therefore, you should replace them all with shielded ball bearings. If the model has been run with ring type bearings, you may have to change all the axles and driveshafts. For more information, take a look at my article, How to get the best from your Bearings.

Finally, good luck with your Nitro Evader BX model and good racing. Fitting the Tires onto the rims can be messy, so here are a few tips to make it a bit easier. To do this, I recommend using a wood

lathe and a piece of wood, at least 300mm long, and more than the width of your wheels, with medium grit emery paper stuck to it. This will also be used for truing a wheel. Described later They will not function as they should without them. And if you are totally serious about your racing they should be glued to the rims. You should also have at least three different compounds Soft, Medium and Hard for varying track temperatures in On Road tarmac racing Touring cars and varying pin sizes for carpet and Off Road racing Buggys and Trucks. Even the top level racers rely on a bit of local knowledge on tracks they have never raced before. The smallest changes can make a huge difference in the way your car performs on the track and our comprehensive instructions will help you to find the best Setup to get you where you want to be. It is generally cheaper than new, ready built and may come with a variety of expensive hopups already installed. Cheap, preloved bargains are always becoming available. However, depending on the age of your purchase, it may need a little tender loving care before you can take it out on the back yard. The one thing you will always need is an instruction manual. If not supplied with your purchase, they can often be downloaded from the Duratrax website, or purchased separately on eBay. With an instruction manual, any problems with your model Truck you may discover, can easily be fixed. Then, take a screwdriver and box spanner and check each self tapping screw and nut for security, taking care not to over tighten. Next, for those Duratrax models with oil filled shock absorbers, remove them from the chassis and dismantle the coil springs. The damper shafts should push in and pull out with a smooth action.

If you feel a jolt as you change direction, this means the oil has leaked out and must be topped up. At the same time, change the ORing seals to prevent more leakage. Also check the damper shafts for damage. If they are scratched, change them as soon as possible. Also, for added protection and if available for your Nitro Evader ST model, fit an under guard to stop dirt and gravel entering the chassis. If possible, change them for titanium. If the model has been run with ring type bearings, you may have to change all the axles and driveshafts. For more information, take a look at my article, How to get the best from your Bearings. Finally, good luck with your Nitro Evader ST model and good racing.

To start the engine, a battery powered Starter, or Glow Igniter, is connected to the Glow Plug and electric current heats the coil to white hot, so that when you pull start your engine, the air fuel mixture in the cylinder is ignited. With the engine now running, the starter is no longer required. Heat generated under compression is enough to keep the coil element hot enough to keep the engine running. To test your Glow Plug, remove it from the cylinder head and place it in the igniter. If the coil instantly glows bright orange, the plug is healthy, a weak or no glow at all, indicates probable burn out. The fastest car on the track is rarely the one that wins, its the one that can accelerate out of corners under control, and remains consistent and efficient from the start to the end of a race. Gearing for a five minute race was a balancing act. But with the development of the new high capacity batteries, brushless motors and smart ESC, all that changed. Now, gearing is

more of a matter of what suits your driving style and how quick your reflexes are on the sticks, the trigger and steer wheel of your transmitter. So, where do you start? After a while, as your knowledge grows, tweaking a few things here and there can give you that small edge to keep you competitive. So, it follows that on tracks you don't know, you should talk to the locals there, who may be racing a similar model to your own, and adjust your setup to suit. I have included many pictures to allow the winner of this auction to see what they will receive. Radio controlled auto racing is a hobby that teaches mechanics skills, electric skills, teamwork, competition, and how to have fun. The Nitro RS4 3type SS is specially designed to have excellent handling and uses the highest quality parts for durability and high performance. Take the Nitro Evader st to the off road track, jump hills climb mountains this vehicle will blow your mind how well it handles through the toughest tracks.

I purchased this item through the pawn shop, and am reselling it here on eBay so that we can keep our internet sales up and going as much as possible. I will guarantee that I will ship the item as quickly as possible and as soon as your paypal payment clears. I will also give a 3 day money back guarantee that the item is listed Thank You for your purchase and bids!!! Stretch Armstrong. Please try again. Please try again. Refer to page 3 of manual for details. To calculate the overall star rating and percentage breakdown by star, we don't use a simple average. Instead, our system considers things like how recent a review is and if the reviewer bought the item on Amazon. It also analyzes reviews to verify trustworthiness. Please try again later. GIZMO 4.0 out of 5 stars. Something went wrong. If you're a remote controlled vehicle hobbyist, you're sure to have a wishlist of parts that would help to make your vehicle perform all the better. Many enthusiasts also like to keep a stock of spare parts, especially when it comes to parts that aren't so easily replaceable. Sometimes it's the aesthetics that are the most important, for example if your car is ticking all the boxes from a technical perspective you might want to invest in new body parts or interior accessories to make it look even better. This collection also includes many popular accessories, including repair kits and various tools to help you install your new purchases quickly and effectively. Some of the most in demand products in this category include multipurpose tool sets that include a range of common tools that will help to fix a host of problems or fit the most frequently used parts. These can include everything from screwdrivers to tape and are sometimes specifically designed for certain vehicles.

Other popular items for RC model vehicles include engine parts that are suitable for everything from repairs to upgrades. As the powerhouse of every RC vehicle, ensuring the engine is in full working order and is optimised to excel is essential. To ensure you're fully prepared in case of an emergency, keeping spare engine parts readily available will let you fix any faults or damages quickly. Suspension, gears and gearboxes are also a large part of the collection. Suspension is often important for off road RC vehicles, and there are an excellent variety of affordable parts to help enhance your vehicle's suspension. To ensure that you have full control over your vehicle, repair or replace any damaged control or radio components. Having spare receivers and transmitters will ensure that your remote control can communicate with your vehicle. User Agreement, Privacy, Cookies and AdChoice Norton Secured powered by Verisign. Forum questions or problems Test Posting Forum The instructions given are not written by OS and instruct you to run the motor far too lean. If you follow these instructions, you will be following the next tip to send your motor back to Duratrax. When they send you a new engine, you'll notice that the instructions are completely different. To prevent going through this whole poop process, follow the new instructions for break in. The Evader itself has a little advertised 90 day bumper to bumper warranty in addition to the 1yr stress tech. Flooding your

engine is a quick way to break your starter due to hydrolocking. Your oneway bearing insider the pullstart wont take much abuse at all.

If your cord is broke, youre probably pulling the thing too hard and too far. You should be taking very short maybe 6 inch pulls. Okay, so your cord isnt broke. Pull it and listen to the pullstart. Its not fun to try to put it back together. I used a bent paperclip to pull the oneway bearing out of the spindle. Contributed by Everyone Evader Parts Dude. There have been tips on how to fix this with a rubber band, but I dont think thats too great of an idea. The best bet is to get a better tank. However, if youre on a budget, you could always try the rubber band idea. Just take the tank off and toss a few highly wrapped rubber bands on it. You can put a zip tie on the rubber bands so they are easier to pull away from the lid. Its a good idea to fix this soon, as youll dirty your ride up in a jiffy with gas leaking all over it. Not fun to clean up. Contributed by Me and a million others. Contributed by dicko Steering Servo Get that stinking SX100 servo out of there. You need a nice metalgeared hightorque servo. The stock setting doesnt have much give even if its completely loose. Starting Problems Just like the manual says, try starting the engine at 50% throttle. If your carb is out of tune, just turn the radio gear off, plug your glow igniter in, and use a finger to open up the carb by pushing on the servo horn. Another thing I noticed is that it totally hates slightlygoing glowplugs or batteries. Its a very finicky motor. Notch the lip the width of the wire for the failsafe, then notch out the same width on the cover in the same spot. If you plan on running your vehicle in cold weather below 45 degrees F, you may experience parts breaking easier than under normal operating conditions. If you must run in cold temperatures below 45 degrees F, one option to help limit breakage and increase the toughness of nylon parts chassis, suspension arms, bulkheads, etc. is by disassembling the vehicle and boiling only the nylon parts for 2 hours.

This will cause the nylon parts to be more flexible than usual. Wait for the nylon parts to cool completely before reassembling. This will not solve all problems in cold weather running. If its all in the same format people will be able to find their problems a lot easier. Should help all those evader guys out there. Sadly, Id rather take the stupid time to pull the plug. Send him your engine and ask him to send it in for you. Give him a few bucks for it. Not sure if thats too practical or not. This conversion makes your engine more reliable and longer lasting. I have done this swap to the DTX.18 myself, and it works great. Contact your local importer first then if you dont have any luck email the guys in the States. It should only take between 610 tanks of fuel before it is fully broken in. Your needle will be around 2 turns out from close but it will vary depending on the engine. Do not let your engine run at idle for very long until it has been broken in completely. Idling during breakin will cause the parts to breakin at too low of a temp and will cause eventual failure when engine gets hotter. How much will I have to grind down Taking things apart is always fun, especially when you can fix it up. Im still trying to peg the differential thing. Do I just send them to Duratrax Do I just send them to Duratrax Q2 Cant say Ive sent little stuff back. Im too impatient and shipping costs would negate the fact they are covered under warranty. I figure this way I can properly mount a good wheelie bar, add some weight to the front for more responsive steering, and protect the batteries and the box! from getting torn to shreds. Anyone done it Anyone think I should do it Basically I lost my seal on a jump and blew all my oil out.

Tightened down the spring to give it some more strength till I repaired the shock, and lowand behold I jumped again and the suspension shot down like a rock ripping the damn shock piston OUT and letting my shaft pop out, which without the resistance caused my engine to speed up and die. I havent gone through the whole 125 pages yet. Does the OS.12 cvrx fit in the evader or should I go with the.18 Use of this site indicates your consent to the Terms of Use. What are the 3 screws for on the carb and what should i start with for a base setting on them. One screw is on the part of the carb that movesidle screw maybe Theres a small one with a spring on it, and the main one that the fuel line basically comes off of.any help would be greatly appreciated! thanksYou sure it is not a Nitro Evader ST. The one with the spring on it should be the Idle Set Screw. The one you refer to as the main one, is you HSNhigh Needle. The one that is left on the rotary part of the carb is you LSN. First step is to get it to start. I dont know the factory settings for that carb. If it starts the just make sure it is spitting fuel out the stinger and go from there. I like to start with the HSN and monitor my temps. I dont like to tune by temp but it will get you to a safe zone. Once you have the HSN close then move to the LSN. If you pinch the fuel line were it enters the carb and it revs up and dies immediately then the LSN is lean. I like for it to run 45 seconds after pinching fuel line. I would also put a fresh glow plug in it. Hope this helps. T.As far as the idle issue. I would make sure the idle gap is not too wide. See if there is anything in that manual about idle gap. Pull off the air filter. The gap should be pretty small. If it seems like it is open alot the turn down idle and play with you LSN. This is kinda tough over a forum. Then we get into air leaks.I have to turn the hsn out correctUse of this site indicates your consent to the Terms of Use. Use of this site indicates your consent to the Terms of Use.
