Installer Manual. CONCEPT IQ. Inner Range Concept Onwatch. See Tip on page Comprehensive online help is provided in the Insight software. Each time a key is pressed the Concept will emit a short "beep" to indicate that the key was accepted. Enable Terminal Configuration Mode.

In other sites Panic may be treated as a "Silent" system alarm with a report sent to a remote monitoring station and no local action at all. Typically a "Silent" alarm is activated. A discreet alarm report is sent to the remote monitoring station These messages provide precise information of the type of alarm, the Area it has occurred in, and the Zone or System Input that generated the alarm. Latching alarms enables all alarms in an Area to be individually viewed when this message is displayed. This may be necessary to find out details of user activity or past alarms, etc. You can use these filter keys in conjunction with the UP and DOWN Arrow keys to locate a specific event and then review all the other events around it in more detail. Note Greeting can be disabled in V3 or later. See "Activating a Duress Alarm" for details. Whenever that PIN Code is now used, the LCD Terminal will display a warning "Your pin has been discovered by another User. Ask the Installer for the Entry time used in your system. However, only Areas that are in the Area List selected and are also in the Area List in your "User Type", or your "Extra Area" will be turned Off. The User can still perform the Area Off or Area On operations during this warning period, but if no action is taken the Area will automatically turn On when the warning period expires. In most systems this feature is not enabled and the Area ON procedure will simply be performed as described below. If Walk Testing is enabled on your system, the same procedure is followed except that after the initial test to ensure that all Zones are Sealed, the system then enters Walk Test mode. Remember You have a limited time to exit the Area once you have turned it ON. Usually 3090seconds. Ask the Installer for the Exit time used in your system. A door or window has been left open. Try to rectify the problem before trying again. Note that System Inputs can also be isolated. e.g. "Expander 01 Ext.

Siren Tamper" could be isolated while damaged speaker cabling was awaiting repair. The settings can only be programmed by the Installer, who can also advise you on the appropriate options. This is useful when the Terminal only provides control of one Area. An option is also provided to allow the UP and DOWN Arrow keys to be used to view the name and current status of up to 8 sequential Areas. The settings can only be programmed by the Installer, who can also advise you on the appropriate options. There are ten main menu options in the system, numbered from 0 to 9, but User programming will determine which options will be available to each User. This will be necessary when the system is first commissioned and for daylight saving changes. This may be done automatically by the system, or in some reporting formats, by the Central Station. Spaces instead of digits means ignore that Start Time or End time in that particular period. e.g. 1900to A name of up to 16 characters can be programmed in the same manner as described for User names. Additional information is provided in the Programmer's manual. The next screen defines the control options The Qualify options allow the TimeZone to be Qualified by an Auxiliary. If this option is used, the TimeZone will only be Valid when a TimeZone Period is Valid AND when the Qualify conditions are met. When the Aux. is On, TimeZone will always be Invalid, regardless of whether any TimeZone Periods are valid. Holidays are used with TimeZones to define whether a TimeZone will be Invalid or Valid on dates designated as Holidays. In most systems, holidays will not need to be broken down

into different types, so all Holidays will be assigned "Type 1" only. A name of up to 16 characters can be programmed in the same manner as described for User names. The display will show the current Start Date and End Date of the Holiday. An explanation of Holiday Types is found on the previous page.

Diaries are mainly used to display customised messages on selected LCD Terminals at various selectable times. This will make the Diary continuously valid. Up to 16 characters of text can be programmed for the 2nd line as described above. This Auxiliary will turn on when the Diary is valid, and off when invalid. The system can perform automatic testing on devices that are regularly activated by movement, etc., such as PIRs and Door Contacts. They provide a comprehensive range of Testing to assist with installation, commissioning and service of the system. The display will update with a beep every few seconds to show any Zones that have not been tested. The following key functions are available while this display is shown, and may need to be used if any device fails to operate or cannot be tested. The display will briefly show "Operation Aborted", then return to the "Area to Test" prompt. This involves setting aside a period when all Areas in the system are turned ON, then activating all the Input Devices. A report from the Central Station is then used to check that all devices activated were reported. This method also tests that Input processing and Reporting options have been programmed appropriately, and that the alarm reporting is occurring effectively. There may be cable damage or a module problem. Alarm reporting may be compromised. Deferred Area Arming Option. Press OK to move to next programming section. SA61998 SA No. ISL 149773 ACT No. 17501831 QLD No. 40506.
